

Nuclide Chart Viewer — sample outputs

All figures produced by `nuclide_chart_viewer.py` for the isotope ^{81}Ga , reading decay data from the IsotopeDB database built by `isotope-database-builder`.

Chart of nuclides

Every nuclide in the database, coloured by ground-state half-life on a log scale (dark: sub-millisecond; light: quasi-stable; 1e30 s stands in for stable). The inset zooms on the 5x5 neighbourhood of the requested isotope, here 81Ga at $Z=31$, $N=50$, with name, decay mode and half-life in each cell.

Decay chain of 81Ga

The main chain runs $^{81}\text{Ga} > ^{81}\text{Ge} > ^{81}\text{As} > ^{81}\text{Se}$ to stable ^{81}Br ; each arrow carries the branching ratio, half-life and decay mode. The downward branch is the 11.9% beta-delayed-neutron decay to ^{80}Ge , which continues through ^{80}As to ^{80}Se .

Activity of the chain members

Activity of each member of the main chain against time, starting from 1 GBq of pure 81Ga, computed by matrix exponential of the decay matrix (Bateman problem). Each daughter rises to a maximum set by its parent feed rate, then follows its own half-life down.
